

EMULTROL DFM DV-15 FG

BEER DEFOAMER

EMULTROL DFM DV-15 FG, acts as an anti-foam agent in the management of yeast waste, helping to control the foam formed by the release of carbon dioxide during its treatment.

- **Improves the reproducibility** of the residual yeast treatment process.
- **It reduces the volume of foam** formed in its unloading prior to transport by increasing the yield in weight per load.
- **Reduces the risk of spillage** during unloading processes

DOSAGE:

- It is recommended that the dosage of the defoamer be adjusted experimentally as it depends on the composition, density and type of yeast.
